Methods chose patterns Design :

The factory pattern is a design used in patterns in java. This type of design template Comes from the model of creation because the model provides one of the best ways to create objects. To better illustrate the point, a factory method is a method that allows providing an interface to an abstract class to generate objects in a superclass. It also allows subclasses to modify the different types of objects that will be generated. In factory models, he creates objects without exposure to the logic of creation. We refer to newly created objects using a standard interface.
